

SDLC

ASSIGNMENT 1

An Infographic that outlines the SDLC phases.

The SDLC (Software Development life cycle) is a structure process to develop high quality software through distinct phases.

1) REQUIREMENT -

The requirement analysis is also performed by the developers of the organisation. This is attained from customer inputs and sales department. It understands customer needs to set clear instructions.

- It prevents costly misunderstandings.

2) DESIGN -

With the requirement in SRS multiple designs for the product architecture are present in design document specification. It creates system architecture and blueprints.

- It guides developers and reduces errors.

3) IMPLEMENTATION -

After testing the overall design the software will come together and develop the actual software by coding.

- It turns plans into a working product.

4) TESTING -

During the testing stage developers go over their softwares to validate functionality and note any bugs that need to be tracked, fixed and later retested.

5/ DEPLOYMENT -

After retrieving feedback, the company releases it as it is or with auxiliary improvements to make it further helpful for the customers.

- It makes solutions operational

INTERCONNECTION -

Phases thus sequentially with feedbacks, loops agile models revisit phases iteratively:
